                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NS-09-252-991A-28658
Sequence 28658, Application US/09252991A
Patent No. 6521795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINGA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION UNMERR: US/09/252,991A
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 28658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4258, Application US/09134001C

Patent No. 6380370

                                                                                     Pharmaceutical composition useful for promoting weight loss, comprises an insect adipokinetic hormone, having a pyroglutamate residue at its amino terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In a human which comprises administrating an insect adjokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, heparotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II atheres, cholelithissis, hypertension, coronary heart disease, atheroscierosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the honeybee AKH peptide of
                                                                                                                                                                                           antidiabetic; hypotenaive; cardiant; antiarthritic; cytostatic; nephrotropic; hepatotropic; analgesic; cerebroprotective; uropathic; obsatry; type II diabetes; cholelithiasis; hypertension; coronary heart disease; atherosclerosis; glycogenosis; arthritis; cancer; renal failure; liver; chronic pain; sleep apnea; stroke; urinary incontinence; honeybee.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition useful for promoting weight loss, comprises an insect adipokinetic hormone, having a pyroglutamate residue at its amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone factor. The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, heparotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

intertion by an acid-resistant microorganism (A) by treating a faccal sample with at least two different monoclonal antibodies (MAb) (or their fragments or derivatives) or aptamers (collectively (1)) and detecting formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (A). The first and second (I) bind to epitopes of different antigens (A). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (i) their native structure; (ii) a structure against which an antibody is produced by an animal infected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, M. tuberculosis, C. jejuni and C. pylori. (I) may also be used therapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible sequence represents a fragment of a H. pylori beta-urease-binding antibody heavy chain complementarity determining region CDRI which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               this invention describes a novel method for the detection of a mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a fecal sample with two binding reagents for antigens that survive intestinal passage.
                                                                                                                                                                                             Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; heavy chain; complementarity determining region; CDR; beta-urease.
                                                                                                                                                            H. pylori beta-urease-binding antibody heavy chain CDR1 protein #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Friedrichs U, Heppner P, Lakner M;

The method is used to diagnose infection by an acid resistant microorganism (A), in a mammal, such as Helicobacter, Campylobacter or Mycobacterium, particularly H. pylori (most preferred), H. hepatica, C. jejuni and M. tuberculosis. The method is rapid, simple, inexpensive and non-invasive, and may indicate the stage of infection. A test strip used in the method may indicate the stage of infection. A present in the sample and only a single receptor provides a reasonably secure diagnosis, with specificity and selectivity improved by detecting several epitopes (of catalase) or different antigens (catalase) and betaurease). The method can be automated. This sequence represents a urease). The determining region (CDR) from an antibody raised against the H. pylori catalase or beta-urease antigen which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting infections by acid-resistant microorganisms, particularly for diagnosing Helicobacter pylori, comprises immunochromatographic detection

This invention describes a novel method for detecting, in a mammal, infection by an acid-resistant microorganism (A) which comprises reacting a fection by an acid-resistant microorganism (A) which comprises reacting a fection by an acid-resistant microorganism (B) such that a complex is formed with an antigen (Ag) of (A); or (ii) two different R so that a three-part complex is formed with Ag, and the formation of a complex detected. R are specific for an Ag which, after passage through the intestines, at least in some mammal produces antibodies (when immunized or infected with (A), or its extracts, lysates or derived proteins (or fragments) or synthetic peptides). The products of the invention have antibocterial activity. The method is used to diagnose infection by Helicobacter.

Campylobacter or Mycobacterium, particularly H. pylori (most preferred), H. Appartias, C. jejuni and M. tuberoulosis, and also to monitor the progress of treatment. Receptors, particularly antibodies, directed against Ag can be used therapeutically for treatment of infections. The complements and more easily standardized. Also it is direct, non-invespensive and more easily standardized. Also it is direct, non-invespensive, suitable for automation and may indicate the stage of an investure an antibody generated against a Helicobacter pylori antigen continuation.

Code investure the method of the continuation of illustrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, hepatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II diabetes, cholelithiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH peptide 2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The method involves incubating a library of phage particles with the target cells to allow binding of the antibody fragment expressed on the surface of the phage particles to the antigen associated with the target cells. The method is useful for obtaining human antibodies against known and novel surface antigens in their native configuration, expressed on phenotrypically defined subpollations of cells. The present sequence is complementarity-determining region 3 (CDR3) of monoclonal phage
                                                                                                                                                                                                                                                                                                                                                                                                                         Obtaining a phage particle, useful for obtaining human antibodies against known and novel surface antigens, by incubating a phage library with target cells to allow binding of the antibody fragment to the antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phage; antibody; antigen; target cell; phage particle; cell-type specific phage antibody library; phage antibody; Phab; monoclonal phage antibody; MoPhab; blood cell; foetal bone marrow cell; complementarity determining region 3; CDR3; human.

target cells.

```
The invention discloses a method for obtaining a phage comprising an antibody, or its fragment, directed against antigens associated with a targed cells surface in a heterogeneous cell population. The method comprises providing a library of antibodies, or their fragments, expressed on the surface of phage particles, incubating the phage antibody library with the target cells, separating the phage cells and phage particles associated with them from the phage particles not associated with the target cells and then recovering the phage particles. Also disclosed is a cell type specific phage antibody library and an antibody, or antibody fragment, obtained using the method is useful for obtaining a selection of phage antibodies (Phabs) and monoclonal phage antibodies (MoPhabs). The method is also useful for detecting known and novel structures on various populations of blood and foetal bone marrow cells. The sequence presented is an example of the partly randomised human complementarity determining region 3 (CDR3) used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytokome; kinasin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;

Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific T cell line. Amino acids 66-80 (AAR97884) and 186-200 (R978908) of the full marure 460 amino acid allergen are the most allergenic of the 90 peptides tested
                                                                                                                                                                                                                                                                                                                                                                AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II. Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific Teell line. Amino acids 66-80 (AAR97884) and 186-200 (R978908) of the full mature 460 amino acid allergen are the most allergenic of the 90 peptides tested
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Japan cedar pollen allergen Cry j II epitope - comprises at least part of specified 460 aminoacid protein.
                                                                                                                                                          Japan cedar pollen allergen Cry j II epitope – comprises at least part of specified 460 aminoacid protein.

The peptides are derived from Japanese cedar pollen antigens, and are used as immunochrerapeutic agents in the treatment of allergy. The peptides can be used for identification and typing of the particular HLA class II molecules in an allergy sufferer, and also for peptide immunotherapy of an allergy. Using these peptides the immunotherapy can be targeted more specifically to the requirements of the individual patient, allowing more effective treatment of an allergy, including those patients for whom treatment with a conventional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides derived from Japanese cedar pollen antigens are immunotherapeutic agents - useful for allergy treatment and typing HLA class II molecules in Allergy sufferers.

The invention relates to human thioredoxin nucleic acid and polypeptide molecules, designated 22108 and 47916. The compound that modulates the activity or expression of 22108 and 47916 nucleic acid is useful for treating or preventing a disorder characterised by aberrant activity of the 22108 and 47916 reducing or inhibiting the aberrant activity of the 22108 and 47916 reducing or inhibiting activity of the 22108 and 47916 reducing or inhibiting preventing or treating cancer and polypeptide are useful for diagnosing, preventing or treating cancer in a subject (e.g. carcinoma, sarcoma, materateic or hammatopoietic disorders (e.g. leukaemia), or cancers of the lung, breast, thyroid, head neck, prostate or genito-urinary tract), cardiovascular diseases (e.g. angina pectoris, arteriosclerosis or heart diseases). The thioredoxin DNA is also useful in gene therapy. The present sequence is human thioredoxin, 47916 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T-cell epitope peptide 45 from Japanese cypress pollen antigen Chao2

describes a mixture or panel of 5 different specific binding members, and the comprising an antibodies of the invention. The specification describes a mixture or panel of 5 different specific binding members, and normalisation and antibody WH and/or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when bound to human serum amyloid protein, to pass through a mammalian blood brain barrier (BBB). The panel is useful for the selection of specific binding members with a dealred property such a ability to cross BBB, ability to bind endothelial cells or other brain cell antigen, ability to bind intracellular adhesion molecules and to bind transferrin receptor. The antibodies are useful in diagnosis, prophylaxis such as Alzheimer's disease, prion disease, AIDS-related dementia, such as Alzheimer's disease, prion disease, AIDS-related dementia, epilepsy and traumatic brain injury and any diseases involving inflammation occurring within the brain or central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated or recombinant polypeptide for use in modulating a plant
growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or
Oryza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plant growth; plant growth trait modulation; Brassicaceae; Arabidopsis; Brassica; Zea; Oryza; Tritticum; Hordeum; Lollum; Sorghum; Glycine; Medicago; Hellanthus; Lactuca; Beta; Vitis; Solanum; Lycopersicon; Capsicum; Gossypium; Hevea, Linum; Prunus; Citrus; Populus; Pinus;
                                                                                                                                                                         AAG62970-AAG63005 represent complementarity determining region 3 (CDR3)
                                                      Mixture or panel of antibodies for selecting specific binding members that cross the blood brain barrier, for use in delivering different molecules and treating neurological diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a T-cell epitope peptide from Japanese cypress pollen antigen Chao2. The present invention describes peptides which correspond to the T-cell epitope sites on Japanese cypress pollen antigens Chao1 and Chao2. The peptides can be used as a reagent for the diagnosis of allergy to Japanese cypress pollen, and as an antigen in the treatment and prevention of spring tree pollen disease in which the pollinosis involves reactivity to Japanese cypress pollen. 0
                                        comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in the specification, or a conservative variant; (b) encoded by 1 of 30 sequences (S2), as given in the specification, or a conservative variant; (c) encoded by a sequence that hybridises under stringent conditions to S2; and (d) encoded by a sequence 70 % identical to S2. The expression or activity of (I) is modulated to modulate a plant growth trait in a plant that is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum, Lycopersicon, Capsicum, Lactuca, Beta, Vitis, Solanum, Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus, Binus, or Anew method is used to detect genes for a plant growth trait. This is the maino acid sequence of region of AbE25056 used to demonstrate conservative substitutions occurring in the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human single exon nucleic acid probes (SENP): see AALIO068-AAI204459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                               by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing
measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         encoded by one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes (SENP: see AA13135-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray to predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #5114 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                            Gaps

```
The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be unvolved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG4748-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent doses not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   exon nucleic acid probes useful for analyzing
                                                                                                                                           Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  73.9%; Score 17; DB 4; Length 27; 40.0%; Pred. ```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from thusan lung comprising single exon nucleic acid probes having one of from human lung comprising single frames derived from the 12614 complements or the 12187 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung, comprising the novel set of probes (comprising last high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung array at least one exon from genomic sequences of the early strong strong specific hybridisation of detectably bend at least one exon from genomic sequences of the eukaryote; and (b) defecting specific hybridisation of detectably clabeled nucleic acids from eukaryotic genomic sequences of the early and (b) defecting specific hybridisation of detectably clabeled nucleic acids from eukaryotic genomic sequences of the above mentioned microarray; assigning exons to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon microarray above and (b) measuring the expression of each of the exons in the tissues and/or cell types using hybridiation to a single exon from expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one companies and por identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemansky-type companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 27; SEQ ID NO 30187; 634pp; English.

Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 5 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinsons's disease), cognitive disorders, schizophrenia, asthma, skin

disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The process can also be used to aid wound healing and epithelal cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunosasay e.g., radioimmunosasay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention

Producing oil body associated with recombinant multimeric protein complex e.g. redox proteins and immunoglobulins comprises producing recombinant polypeptides capable of forming the complex in cells comprising oil

Claim 81; Page 248; 362pp; English.

The present invention describes a method (M1) for producing an oil body

comprises producing in a coll comprising oil bodies a first and second recombinant polypeptide (Pl, P2), where Pl is capable of associating with P2 to form the MPC and associating the complex with an occlusion body (OB) through an OB-targeting-protein capable of associating with D8 and P2. MI is useful for producing an oil body associated with a recombinant of P1. MI is useful for producing an oil body associated with a recombinant of MPC. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the numan body or used to lighten the skin, or a pharmaceutical composition used to treat chronic obstructive pulmonary disease, (CPDD), cataracts, diabetes, envenomation, bronchiopulmonary disease, psoriasis, an alignancies, reperfusion injury, wound healing, sepsis, gastro intestinal (GI) bleeding, intestinal bowel disease (IBD), ulcers, GEND (gastro oesophageal reflux disease). ABN895593 and ABS60677 to ABP60964 represent sequence given in the exemplification of the present associated with a recombinant multimeric protein complex (MPC). M1 invention

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 45; SEQ ID NO 28347; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule

```
expressed in human cells or tissues. Also included are a spatially-
addressable set of single exon nucleic acid probes for measuring human
gene expression (comprising a plurality of single exon nucleic acid
probes cited above, where each of the plurality of probes is separately
and addressably isolatable or amplifiable from the plurality), a single
exon microarray for measuring human gene expression, a method of
measuring human gene expression, a wector comprising at least 8
contiguous amino acids of any of the above mentioned amino acid
sequences (optionally with conservative amino acid substitutions), an
isolated antibody that binds specifically to a peptide cited above,
methods of selling and/or licensing single exon probes or microarrays to
c sequences (optionally with conservative amino acid substitutions), an
isolated antibody that binds specifically to a peptide cited above,
methods of selling and/or licensing single exon probes or microarrays to
a customer desiring to measure gene expression, a method of providing
c acustomer desiring to measure gene expression, a method of providing
c thuman gene expression data by subscription, and a computer-readable
storage medium which contains a database having a plurality of records
crited above. The probes methods and apparatus are useful in gene
expression analysis. The probes may be used as tools for surveying
clied above. The probes may be used as tools for surveying
clied above. The probes are used in identifying and characterising
alternative splicing events, in detecting and characterising
alternative splicing events, in detecting and characterising
calternations in the genomic locus that includes their exon, in assessing
calternations in the genomic locus that includes their exon, in assessing
cor in expressing the ORF-encoded peptide. The sequence is a human
contained in electronic format directly from USPFO at
characteriation; but a directly from USPFO at

Polypeptides of G-coupled receptor proteins (GPRs) - useful for binding

```
Polypeptides AAR48768-81 and AAR50569-R50718 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins, and can be used in G-protein coupled receptor ligand binding assays. The assay can be used to identify fragments pref. transmembrane fragments, from GPR proteins (see AAR48666-R48758 for examples) which retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins, and can be used in G-protein coupled receptor ligand binding assays. The assay can be used to identify fragments pref. transmembrane fragments, from GPR proteins (see AAR4866-R48758 for examples) which retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G-protein coupled receptor; ligand binding assay; transmembrane domain; psychotic disorder; schizophrenia; dopamine; cAMP; adenosine; thrombin; muscarinic acetylcholine; adrenergic; endothelin; bombesin; endocrine; rhodopsin; opsin; odorant; cytomegalovirus; serotonergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptides of G-coupled receptor proteins (GPRs) - useful for binding GPR ligands or modulating GPR binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptides AAR48768-81 and AAR50569-R50718 are based on the consensus
                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Polypeptides AAW02747-W02910 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins and can be used in GPR ligand binding assays. The assays can be used to identify fragments, pref. transmembrane fragments, from GPR proteins (see AAW02657-W02635) which retain biological activity such as binding a GPR ligand or modulating a GPR ligand binding to a GPR (see W02747-AAW0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compsns. for treating subjects suffering from a pathology related to a GPR abnormality e.g. schizophrenia. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptides AAW02747-W02910 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins and can be used in GPR ligand binding assays. The assays can be used to identify fragments, pref. transmembrane fragments, from GPR proteins (see AAW02657-W02635) which retain biological activity such as binding a GPR ligand or modulating a GPR ligand binding to a GPR (see W02747-AAW0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compans. for treating subjects suffering from a pathology related to a GPR abnormality e.g. schizophrenia. (Updated on 25-MAR-2003 to

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO19910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammacopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                   The sequence is of a Japanese cedar pollen allergen Cry j II fragment. The protein and fragments can be used for diagnosis and treatment of Japanese cedar pollinosis and to identify similar sequences in other plants. See also AAR51690-6. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AA008979
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01310) that exhibit activity elating to cytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polympopulates in other cell populations or peptide therapy, The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. steem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of canneer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed determining the amount of the new polypeptides in a sample or by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders kindsy disorders, diseatie, dendorine disorders, infections and ALDS. The polypeptides are also useful for identifying their binding partners. The sequences shown in AAY76224 to AAY76424 represent fragments of the secreted proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
    The genes and their corresponding secreted polypeptides are

AAY76124 to AAY76223 are the secreted proteins encoded by the 97 human genes. This sequence represents a fragment of one of the human secreted
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                            The invention relates to human secreted polypeptides and the polynucleotides encoding them. The sequences are useful for preparing medicaments for preventing, treating or ameliorating medical conditions e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. This sequence represents a human secreted polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor necrosis factor receptor; TNF; T129 protein; TANGO 129; human; cellular process; immunological disorder; abnormal lymphoid development; thymic development; T-cell mediated immune response; humoral B cell; skeletal muscle disorder; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides an isolated human tumor necrosis factor (TNF) receptor member, T129 (also referred as TANGO 129). The T129 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated tumor necrosis factor receptor member used to develop products for treating, e.g. immunological disorders or disorders of the

                                                                                                                                                                                     17-JUN-19
                                                                                                                                                                   6-JUN-1
    can be expressed by standard recombinant methodology. The T219 polypeptides are useful as modulating agents in regulating a variety of cellular processes. Agents or modulators which have a stimulatory or inhibitory effect on T129 activity (e.g. T129 gene expression) as identified by a screening assay can be administered to individuals to treat (prophylactically) or therapeutically) disorders, e.g. an immunological disorder associated with aberrant T129 activity, disorders associated with aberrant T129 activity, disorders mediated immune response, T-cell dependent help for B cells, and abnormal humoral B cell activity, and possibly disorders of the skeletal muscle. The products can also be used for detection, diagnosis, drug screening and production of transgenic animals. The present sequence represents a TNFR/NGFR cysteine-rich domain of T129 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                          gene expression.
                                                                                                                                            Gaps

The polynucleotide sequences given in AAF33037 to AAF33085 encode the human secreted proteins given in AAB64666 to AAB64714. AAB64715 to AAB64717 represent human secreted polypepide sequences and proteins homologous to them, which are given in the exemplification of the proteins homologous to them, which are given in the exemplification of the prosent invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: Cytostatic; antirheumatic; antiarthritic; dermalogical; cardiant; and rationflammatory; gastrointestinal; and anti-ulcer. The polynucleotides of diseases associated with inappropriate polypeptide expression. Disorders that may be treated or prevented include expression. Disorders that may be treated or prevented include solid tumours, reumatoid arthritis, psoriasis, diabetic retinopathy, myocardial cangiogenesis, Crohn's disease and ulcers. The polynucleotides and their complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients may be in need of restorative therapy. The polypeptides may also be used as antigens in the production of antibodies against the proportion of polymeral in assays to identify modulators (against the proporties and in assays to identify modulators (against the proporties) of polymeral and antigens in the production of antibodies against the proporties and an assays to identify modulators (against the proporties) of polymeral and antigens in the production of antibodies against the proporties and an assays to identify modulators (against the production of antibodies against the proporties and proporties and an assays to identify and activity of antibodies against the production of antibodies against the proporties and and an assays to identify and activity of antibodies against the antibodies and antibodies and antibodies and antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antagonists) of polypeptide expression and activity. The anti-polypeptide antibodies and antagonists may also be used to down regulate expression and activity. AAF33028 to AAF33036 and AAB6465 represent sequences used in the exemplification, of the present invention
                                                                                                                                                                                                                                                                                                                                                   Human; secreted protein; diagnosis; cytostatic; antirheumatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, call proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 20; SEQ ID NO 20727; 1399pp + Sequence Listing; English.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the disquosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                              Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                 Human brain expressed single exon probe encoded protein SEQ ID NO: 36935.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single exon nucleic acid probes for analyzing gene expression in human brains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; SEQ ID NO 36935; 650pp + Sequence Listing; English.
